

What the scheduler decides, by battery state and request

GPU 1200 MHz, K 1024 GPU 1200, decode cap 726 GPU cap 726 MHz CPU, K 512
 GPU 1200, decode cap 902 GPU cap 902 MHz CPU, K 1024 CPU, K 256

Upper band: backend, clock (prefill / decode), cache. Lower band: output length rule. The CPU clock is never a decision: it saves no energy on this phone. The lever (1 at mains and above 50%, 0.5 at mid, 0 when low) sets the exchange rate, the quality floor and the time budget; a step down must save at least λ times its time cost, keep quality above the floor, and fit the time budget. Split plans are predictions until measured.
