

μ KV — 8 controllers (L1 → L8 in execution order) and firing timeline

Per-token decode cost: $t_{\text{step}} \approx \frac{K_h \cdot d}{\text{BW}_{\text{DDR}}(T_{\text{DDR}})} \cdot \frac{1}{f_{\text{CPU}}(\text{tier}(t))}$ — K_h set by L2 + L8, f_{CPU} capped by L7
